## **EXHIBIT 4: ENVIRONMENTAL IMPACTS**

---

### **4.1 Introduction**

This Exhibit summarizes potential environmental impacts associated with the Project.<sup>1</sup> The Project will be designed, constructed, maintained, and operated to avoid or minimize impacts to environmental resources in its vicinity. A combination of agency consultation, literature reviews, GIS analysis, and field investigations were conducted to assess the potential Project impacts to the following environment resource categories:

- Land Use
- Visual Resources
- Cultural Resources
- Terrestrial Ecology and Wetlands
- Wildlife
- Threatened and Endangered Species
- Topography and Soils
- Water Resources
- Noise
- EMF

This exhibit describes existing conditions; study methodologies; the anticipated impacts of the Project on environmental, visual, and socioeconomic resources; and appropriate measures to avoid impacts or to mitigate unavoidable impacts.

---

<sup>1</sup> For clarity and consistency, the Application includes a Master Glossary of Terms that defines terms and acronyms used throughout the Application.

#### **4.1.1 Potential Impact-Producing Construction Activities**

Construction of the Project will entail several distinct activities that are expected to progress in a linear and orderly manner from one point to another along the entire length of the Project ROW. The overall construction schedule will be based on outage constraints and the corresponding sequencing of construction activities aimed at maximizing work efficiency and minimizing environmental impacts and disturbance. The general construction activities that will occur are described in the following subsections.

##### **4.1.1.1 Clearing**

Trees and shrubs within the Project Area will be mowed or cleared, as necessary, to provide unimpeded and safe access to proposed structure work sites. In addition, danger trees will be side trimmed or removed. Shrubs and low-growing vegetation, as well as buffers at streams or in visually sensitive areas, may be maintained if they do not interfere with the construction activities or operational integrity of the Facility. Because the Project will predominately be located within Existing ROW, it has been designed to avoid steep slopes and heavily timbered areas. Shrubs and low-growing vegetation, as well as buffers at streams or in visually sensitive areas, may be maintained if they do not interfere with the construction activities or operation integrity of the Project.

The Existing ROW has been maintained by NYSEG in accordance with its Transmission Vegetation Management Plan adopted by the New York State Public Service Commission pursuant to 16 NYCRR Part 84, as same may be amended from time to time (ROW Management Plan) and has well-established herbaceous and shrub communities. The ROW Management Plan was formulated to consider soil stability, protection of natural vegetation, and the protection of adjacent resources (including any natural habitat for wildlife). Upon Project construction completion, the New ROW will be maintained under the ROW Management Plan, which may be amended as needed, to allow the same herbaceous and shrub cover type that occurs on the Existing ROW.

The vegetation management activities necessary for the Project are not anticipated to cause a significant overall change or have a noticeable overall effect on the vegetative communities presently occurring along the Existing ROW. The specific vegetation management techniques and

slash disposal techniques to be used for the Project will be implemented using practices detailed in the ROW Management Plan and will be prescribed on a site-by-site basis in the EM&CP, to be developed specifically for the construction of the Project.

No herbicide/pesticide treatment is proposed during construction of the Project. Herbicide/pesticide may be utilized for routine maintenance of the New ROW. The types, volumes and manner of use of such pesticides and herbicides for maintenance purposes will be in accordance with the ROW Management Plan. The ROW Management Plan requires that the handling and application of herbicides be performed in accordance with NYSEG specifications and all applicable state and federal regulations. NYSEG will ensure that all herbicide applicators are appropriately certified and provided with the appropriate work specifications and instructions. All herbicide applications on the New ROW will be performed under the on-site supervision of a New York State Certified Pesticide Applicator. Upon application, reasonable efforts will be made to inform persons who may be expected to enter areas treated with herbicides.

#### ***4.1.1.2 Access Roads***

Existing access roads or paths in the Project ROW will be utilized wherever possible and will be improved, as required, to provide safe and effective equipment access to each structure location. In some limited cases, it may become necessary to work with adjacent landowners to secure permission for off-site access to support Project construction activities.

Significant environmental impacts to vegetation, water, and soil resources will be avoided to the extent possible by using existing access roads or paths and by properly locating any new access roads that may be required. The use of existing access roads or paths and the siting of new access roads will be based on factors such as: the avoidance of environmentally sensitive features (e.g., wetlands and active agricultural fields); facilitation of future maintenance work; minimization of potential erosion problems; and maximization of the use of existing roadways and cleared Existing ROWs.

Where site conditions, such as streams and wetlands, present a concern on the Project ROW, off-site access will be considered to avoid or minimize impacts. Permission for off-site access will be obtained from landowners if existing rights do not already provide for such access. If it becomes necessary to cross environmentally sensitive areas, protection and mitigation measures such as the

use of low ground pressure or tracked equipment and equipment mats, will be implemented in accordance with the EM&CP.

Stream crossings will be installed in accordance with NYSDEC's Standard Specifications for Temporary Access Waterway Crossing, unless otherwise noted in the EM&CP. In addition, areas disturbed during construction will be restored and stabilized, and all temporary protection measures will be removed following the completion of construction.

The details for the construction of new access roads, the use or improvement of existing roads, and the application of erosion and sediment control measures will be provided on a site-by-site basis in the EM&CP. Erosion and sediment control measures will be designed to maintain and protect soil and water resources both during and following construction activities. Factors considered when selecting the appropriate erosion and sediment control measures include, but are not limited to, the following: timing of construction; accessibility; movement and frequency of construction traffic within the Project ROW; wetland and stream crossings; type and limitations of heavy equipment; and the creation, stabilization and future maintenance of access roads (e.g., cut and fill, water bar, bridge, and culvert installation). During Project operation, similar erosion and control measures may be employed during maintenance activities. Typically, access used for the construction of the Project will also be used to facilitate future maintenance activities.

#### ***4.1.1.3 Laydown Yards***

Prior to construction, it will be necessary to establish areas that will serve as locations for construction-related facilities such as:

- Office trailers;
- Personnel parking and portable sanitary facilities;
- Material, equipment and vehicle storage; and
- Minor equipment and vehicle maintenance.

These areas, referred to as laydown yards, will be strategically placed at selected locations along or proximate to the Project ROW. These sites will normally be adjacent to existing public roads where material deliveries can be efficiently conducted. These areas will be located to avoid

environmentally sensitive features including wetlands, known archaeological sites, and habitats that support rare, threatened, and endangered plants and animals.

An approximately 1.9-acre area located just north of the Proposed Jennison Substation will be used as a laydown area during construction. Other project-specific laydown areas may be identified during EM&CP development. These areas will be of sufficient size to accommodate the materials to be delivered and will serve as a storage yard for materials such as poles, hardware, and conductors delivered from outside the region.

Arrangements may be made with landowners to use locally available and developed commercial properties, thereby minimizing the amount of site preparation and improvement work that would be needed to use an undeveloped site. If such properties or sites are not available, the establishment of these areas could require vegetation clearing; removal and stockpiling of topsoil; site grading; spreading of gravel cover; fencing; lighting, and installation of signage and temporary utilities. Additional vegetation clearing and grading for site access also may be required. After completion of construction, the marshaling yards and staging areas will be restored to conditions comparable to those that existed before construction, unless an affected landowner desires otherwise.

#### ***4.1.1.4 Construction and Upland Structure Installation<sup>2</sup>***

The primary construction activities at each new structure location will be foundation installation, structure fabrication, and structure erection. The steel monopole structures constructed as part of the Project will either be direct embedded or will utilize a concrete caisson foundation, the determination of which will be made during detailed engineering. These major activities, as well as all other minor activities associated with the erection of each structure, will take place within the Project ROW and other work areas specifically designated in the EM&CP.

The placement of transmission line structures in stream and wetland areas and on steep slopes will be avoided where possible. Transmission line structures will not be placed within locations supporting rare plants, where feasible. Advance planning will assure that tree cutting and brush disposal are properly conducted; equipment operation and construction activities are limited to

---

<sup>2</sup> No portion of the Facility is proposed to be constructed underground. See Exhibit E-3.

designated areas; the appropriate erosion control measures are applied; and tree marking and selective cutting in the natural vegetative buffers precede structure placement.

#### ***4.1.1.5 Structure Installation in Wetland Areas***

Structure locations will avoid wetland areas to the extent practicable. When it is necessary to locate a structure within a wetland, special construction methods and environmental procedures will be used to minimize adverse effects and protect the wetland's individual functions. Wetlands will be individually reviewed to determine the best method of access to each structure and to prescribe the appropriate mitigation measures, such as the use of equipment mats, to minimize impacts.

Typically, temporary equipment mats will be utilized for access and work pads for structures that will be installed in wetlands. Equipment mats minimize ruts, soil compaction, as well as erosion and sedimentation displacement. Additionally, the mats provide a level, stable work area to set up and operate the equipment necessary for the installation and erection of the steel pole structures. After the area has been prepared, work will begin with excavating holes for the new pole structure using an auger or an excavator. In wetland areas, topsoil will be segregated from subsoil and stockpiled on construction matting or geo-textile fabric.

The steel monopoles will be installed by excavating a narrow hole. Segregated subsoil will be stockpiled adjacent to the excavation. After excavating a narrow hole, a corrugated “grounding” culvert will be lowered into the excavation with a crane or excavator and the area around the culvert will be backfilled with the excavated subsoil, as necessary. The steel pole will then be lowered into the culvert and crushed stone will be backfilled between the pole and the vertical culvert.

The work area will be graded to approximate pre-construction conditions. Segregated wetland topsoil will be placed over the grounding culvert and allowed to re-vegetate with wetland vegetation. Excess soil will be transferred to an upland area in the Project ROW or to an approved offsite disposal location.

Details regarding the size and location of each work area as well as the mitigation measures that will be used to minimize impacts on the wetland will be provided in the EM&CP.

#### **4.1.1.6 *Direct Embedded Structure Installation***

The Project's steel pole structures will be installed by directly embedding the structures into the ground or by placing them in corrugated "grounding" culverts as described in section 4.1.1.5 - Structure Installation in Wetland Areas. Typically, no concrete will be required for a directly embedded tangent structure. Foundation backfill may be native earth, if suitable, or crushed stone. Excess soil will be spread in appropriate upland areas within the Project Area, if permissible, and seeded and mulched to prevent erosion. If soil redistribution within the Project Area is not possible, it will be removed from the Project Area in compliance with applicable regulations.

Foundation design for dead-end and angle structures will consider site-specific soil bearing capacities and subsurface conditions through individual boring investigations at those locations. Where needed, steel angle or dead-end structures will be self-supporting and will require reinforced concrete (drilled caisson) foundations. Specific foundation requirements will be determined through geotechnical analysis conducted as part of the detailed design phase.

#### **4.1.1.7 *Concrete Foundation and Structure Installation***

Use of concrete caisson foundations for steel pole structures will be determined during the detailed design phase. Concrete caisson foundations will include installation of an anchor bolt assembly to support the structure. The concrete foundation construction typically involves the excavation of an 8- to 12-foot-diameter hole to accommodate a 6- to 10-foot-diameter foundation. Holes are typically excavated to a depth of 20 to 40 feet. Foundations may be excavated with a large drilling machine, a tire-mounted backhoe, crane-mounted vibratory hammer, or track excavator. Erosion and sediment control measures will be prescribed in the EM&CP, to prevent runoff from reaching areas adjacent to the Project Area.

Where concrete foundations must be installed in wetlands, excavated topsoil and subsoil will be segregated and temporarily stockpiled on construction matting or geo-textile fabric, and a culvert form will be placed into the excavated hole. Native soil backfill will be placed around the foundation and the segregated topsoil will be spread over the disturbed areas and mulched.

Excess soil will be spread in appropriate upland areas within the Project Area, if permissible, and seeded and mulched to prevent erosion. If soil redistribution within the Project Area is not possible, it will be removed from the Project Area in compliance with applicable regulations.

If the initial excavation or pouring concrete into the caisson form will result in a discharge of water, specific dewatering procedures will be used. Water will be pumped from the excavation area into a containment area situated upland, as feasible. The containment area will be constructed of straw bales and geo-textile fabric and will be consistent with the EM&CP erosion and sediment control criteria. The water will then be allowed to infiltrate back into the ground or filter through and/or overtop the straw bale dike.

After the concrete has been poured and cured and the steel structures have been set, disturbed areas will be finish-graded, seeded appropriately for summer or winter conditions, and mulched. In wetland areas where grades can cause erosion, annual rye seed will be spread over disturbed soils to provide rapid germination of vegetation.

#### ***4.1.1.8 Conductor Stringing***

After the structures are erected, insulators will be installed, and conductor and lightning wire protection (shield wire) will be strung using a lead line and puller/tensioner machine. Lead lines can be walked through sensitive areas, such as wetlands and vegetative buffer zones, with minimum disruption. Conductors will be pulled through stringing blocks by the tensioning equipment staged at appropriate structure locations. During conductor stringing, temporary guard structures will be placed at all highways, railroads, trails, and near existing utility lines to ensure public safety and the continued operation of other utility equipment.

Conductor stringing sites will be designated in the EM&CP at selected locations within the Project Area. Such sites will involve set-up and operation of mechanized pulling equipment and conductor reels. Wetlands and other sensitive environmental sites will be avoided where possible in locating such sites. If they cannot be avoided, temporary equipment mats or other appropriate protective measures will be implemented, as specified in the EM&CP.

#### ***4.1.1.9 Clean-up and Restoration***

Clean-up and restoration activities will be conducted, as required, following construction. Sites requiring restoration resulting from the construction work will be identified and the appropriate restoration measures applied in accordance with the EM&CP. This work may include re-grading, repair of stream banks, temporary and permanent seeding and mulching for erosion control, and

selective tree and shrub plantings. All permanent seeding and planting work will be conducted during the growing season.

## **4.2 Land Use**

This section summarizes existing land uses and land cover in the Project Area. As further discussed below, since the Project will primarily utilize Existing ROW, it will preserve the natural landscape and minimize conflict with present or future planned land use to the maximum extent practicable.

### **4.2.1 Existing Land Uses**

Proposed Line 734 starts at the existing East Norwich Substation in the Town of Norwich. Current land use adjacent to the Substation includes developed residential land, agricultural fields, and forests. From the East Norwich Substation, Proposed Line 734 travels in a south-southeasterly direction approximately 6.7 miles along existing NYSEG ROW to the future North Pond Substation. Land use adjacent to the New and Existing ROW includes agricultural fields, forest, and developed commercial and residential land.

Proposed Line 946 starts at the future North Pond Substation in the Town of Guilford. Current land use adjacent to the future substation includes undeveloped forests, Existing ROW, roadways, and commercial property. From the North Pond Substation, Proposed Line 946 travels in a and then south-southwest direction approximately 14.7 miles along the primarily Existing ROW to the Proposed Jennison Substation in the Town of Bainbridge. Land use adjacent to the Proposed Jennison Substation includes agricultural fields, forest, and developed commercial and residential land. Land use adjacent to the New and Existing ROW includes agricultural fields, forest, and developed commercial/industrial and residential land.

Proposed Line 949 starts at the Proposed Jennison Substation and continues in an easterly primarily within the Existing ROW for approximately 25.4 miles to the Eastern Terminus outside of the Fraser Substation in the Town of Delhi. Land use adjacent to the New and Existing ROW includes undeveloped forests, agricultural fields, and developed commercial and residential land.

The proposed reroutes (Proposed Lines 756, 919, 954, 943, 818, and 823) will require construction of Greenfield ROW between the Existing Jennison Substation to the Proposed Jennison Substation, which will total approximately 2.1 miles. Land use adjacent to the New and Existing ROW includes undeveloped forests, agricultural fields, and developed commercial and residential land.

Table 4-1 (attached) quantifies the lengths of Project ROW within each type of land use, by property classification code based on Office of Real Property Tax Services classifications and county tax parcel information.

Additional resources used to determine existing land uses within the Project Area include:

- Field reconnaissance surveys performed in 2022 and 2023;
- Google Earth satellite/aerial imagery, updated in 2022;
- USGS 1:24,000 topographic quadrangle maps (USGS, 2024); and
- NYSDOT planimetric maps.

#### **4.2.2 *New York State Open Space Conservation Plan, New York CLCPA***

The New York State Open Space Conservation Plan (2016) contains comprehensive recommendations to help local governments and non-profit organizations undertake open space land use planning at regional and community levels.

New York State's open space conservation goals as listed in the 2016 Plan include:

- Protect state water quality;
- Provide accessible, quality, outdoor recreation;
- Protect habitat for the diversity of plant and animal species;
- Improve quality of life and overall health in our communities;
- Maintain critical natural resource-based industries;
- Address global climate change through forest, wetland, and riparian area stewardship, ecosystem protection, urban and community forestry, and community planning;

- Provide places for education and research relating to ecological, environmental and cultural resources; and
- Protect and enhance scenic, historic, and cultural resources.

The 2016 Plan divides New York State into nine regions. The Project is located within Regions 4 and 7: Catskill/Delaware and Central New York. The 2016 Plan includes a list of 132 regional priority conservation projects across the State, one of which is the Susquehanna River Valley Corridor which the Project crosses at two locations. Since the Project follows the Existing ROW at this location, there will be no increased development outside of the ROW and construction BMPs will be followed to ensure minimal impact on the Susquehanna River.

The Project will be in conformance with, and not affect the goals of, the 2016 Plan.

The Climate Leadership and Community Protection Act (2019) requires that the State (i) reduce greenhouse gas emissions to 40% below 1990 levels by 2030 and to 85% below 1990 levels by 2050, and (ii) obtain 70% of all the State’s electricity from renewable sources by 2030 and achieve 100% zero emissions generation by 2040. The Project is a direct result of an Initial Report on the New York Power Grid Study (2021), prepared in furtherance of the State’s pursuit of the above CLCPA goals, which concluded that the Applicant’s electric transmission lines and substations require upgrades to improve reliability and performance. Accordingly, the Project directly supports the goals of the CLCPA.

#### **4.2.3 Local Land Use Planning and Policies**

A review of the available local planning documents confirms that Project activities are consistent with relevant municipal long-term land use goals.

##### **4.2.3.1 Town of Franklin- Comprehensive Plan 2006**

The Town of Franklin’s *Comprehensive Plan* was adopted in October 2006 with the goal to “protect farmland, revitalize existing hamlet centers, preserve scenic and natural resources, conserve historic resources, and enhance economic opportunities for area residents”.

A portion of the Town of Franklin is also within Delaware Agricultural District 2. Figure 4-1 (Agricultural Districts) details farmlands adjacent to the Project Area. Measures will be taken to

minimize disturbance to farmlands resulting from construction. The Project will not interfere with the goals and objectives outlined in the Town of Franklin's *Comprehensive Plan*.

#### **4.2.3.2 Town of Sidney – Comprehensive Action Plan 2002**

The Town of Sidney's *Comprehensive Action Plan* adopted September 2002 presents a plan to improve the economic development and quality of life in the town. The plan includes a Land Use and Zoning Vision, which strives for the "orderly development of its land as suitable for commercial, residential, agricultural, recreational, and open space uses; ensure that land development is conducted in a manner that will protect natural and physical resources and the environment; and will promote land use that furthers the quality of life and economic prosperity of the Sidney area." The Vision identifies the preservation of the Town's rural character and farmlands as a key concern of the residents.

A portion of the Town of Sidney is also within Delaware Agricultural District 12. Figure 4-1 details agricultural district designations within and adjacent to the Project Area. Measures will be taken to minimize disturbance to farmlands resulting from Project construction and operation. The Project will not interfere with the goals and objectives outlined in the Town of Sidney's *Comprehensive Action Plan*.

#### **4.2.3.3 Town of Guilford – 2014 Comprehensive Plan**

The Town of Guilford's *Comprehensive Plan* was adopted in 2014 to identify goals and establish a framework for local decision making regarding future public and private investments in the Town. The *Comprehensive Plan* identifies policy objectives in the areas of agriculture, economic prosperity, individual freedoms, environmental health and community character, recreational opportunities, community, and government.

Support for agricultural economy and the preservation of the Town's natural resources and rural character are key objectives. A portion of the Town of Guilford is also within Chenango Agricultural District 1. Figure 4-1 details agricultural district designations of parcels within and adjacent to the Project Area. Measures will be taken to minimize disturbance to farmlands resulting from construction. The Project will not interfere with the goals and objectives outlined in the Town of Guilford's *Comprehensive Plan*.

#### **4.2.3.4 Towns of Norwich, Bainbridge, and Hamden**

The Towns of Norwich, Bainbridge, and Hamden do not appear to have a Comprehensive Plan or similar policy in place.

#### **4.2.4 Floodplains**

FEMA resources were reviewed in relation to the Project for the following zones:

- Regulatory Floodway
- SFHA (100-year floodplain)
- 0.2 percent Annual Chance Flood Hazard Area (500-year floodplain)

FEMA FIRMs show flood risk information based on historic, meteorological, hydrologic, and hydraulic data, as well as open-space conditions, flood control works, and development (FEMA, 2023). Figure 4-2 (FEMA Floodplains) depicts the Regulatory Floodways as well as the 100-year and 500-year floodplain locations within the Project Area.

According to FEMA's published FIRM for each community, the Project traverses Regulatory Floodways in two locations. These Regulatory Floodway crossings include the Susquehanna River in the Town of Bainbridge, and East Brook in the Town of Hamden.

According to FEMA's published FIRM for each community, the Project ROW traverses the SFHA at seven locations).

The Project ROW also traverses numerous areas determined to be within the 500-year floodplain.

The Project is not anticipated to have an adverse impact on the floodplains. The new structures will have a minimal footprint, will not appreciably change the ground or floodwater elevation, and will be designed in accordance with any applicable substantive flood zone requirements.

#### **4.2.5 Agricultural Districts**

The CRIS Agricultural Districts mapping program was reviewed to determine if the Project traverses any portion of a certified Agricultural District (Cornell Institute for Research Information Sciences, 2023). Agricultural Districts in Delaware and Chenango Counties are shown on

Figure 4-1 (Agricultural Districts). The Project traverses Delaware County Agricultural District Nos. 2 and 12 and Chenango County Agricultural District No. 1 in several locations. Minimal impacts are anticipated, as the Project is proposed primarily within Existing ROW and best management practices (such as avoiding the use of guy lines in active agricultural fields) will be implemented during construction and restoration.

#### **4.2.6 *Potential Environmental Justice Areas and Disadvantaged Communities***

In accordance with the environmental justice goals that are integral to the CLCPA, this section summarizes PEJAs and DACs identified within 3 miles of the Project. PEJAs are identified using self-identification metrics of census blocks that consider themselves to be members of minority groups and/or have household incomes below the federal poverty level. DACs are identified by using a score of 45 key indicators that represent the environmental burdens or climate change risks within a community, or population characteristics and health vulnerabilities that can contribute to more severe adverse effects of climate change. The top 35% of assessed communities are considered DACs.

NYSDEC PEJA mapping shown in Figure 4-3 identified seven PEJAs within 3 miles of the Project, two of which are intersected by the Project (NYSDEC 2020a). NYSERDA DAC mapping shown in Figure 4-3 identified three DAC census blocks within 3 miles of the Project, one of which (the Town of Sidney) is intersected by the Project (NYSERDA 2024).

The Project is being proposed to support the CLCPA's renewable energy goals by providing upgraded electric transmission infrastructure that will allow renewable energy to be safely and reliably transported to load centers throughout the State. The Project will support increased employment opportunities and new industry resulting from the increased demand and capacity for renewable energy infrastructure. The Project also minimizes impact to the nearby PEJA communities and DACs since it proposes upgrading existing transmission lines primarily within Existing ROW. The Project's operation will not result in the production of greenhouse gas or co-pollutant emissions, and thus, will not disproportionately burden DACs and, since it will further the State's CLCPA renewable energy goals, it will help to reduce overall greenhouse gas emissions in the State. As such, the Project is anticipated to positively impact PEJA communities and DACs.

#### **4.2.7 Land Use Impacts and Mitigation**

The Applicant does not anticipate any significant overall changes to existing land uses and their associated environmental resources. The Project Area was selected to avoid and minimize, to the greatest extent possible, impacts to land use, predominantly by locating Project facilities within Existing ROW or transportation corridors throughout its length. The Project is consistent with the 2016 NYS Open Space Plan and the CLCPA, as well as with local land use planning goals and policies, due to the minimal impact of primarily utilizing such corridors and Existing ROW.

The Project would not have any adverse impacts on the floodplain due to the minimal footprint of the proposed pole structures. The new structures will not appreciably change the corresponding land or flood elevation and will be designed in accordance with any applicable substantive flood zone requirements.

The Project traverses a minor area of active agricultural lands within three designated New York Agricultural Districts. During construction, agricultural operations may be temporarily disrupted within the Project Area. The Applicant will adhere to applicable protective methods set forth in the NYS Department of Agriculture and Markets “Guidelines for Electric Transmission Right-of-Way Projects.” These methods include the use of equipment mats where practical, and the removal and stockpiling and replacement of topsoil after construction. Guy lines will not be used in active agricultural fields. If rutting occurs within agricultural fields, the applicable Project Area will be graded and restored to the farm operator’s satisfaction following construction. Restoration measures may include rehabilitation of drain tiles in fields, deep tilling of heavily compacted areas, and thorough removal of all construction debris. The Applicant will consult with the agricultural property owners to optimize placement of structures to potentially reduce impacts from what currently exists.

The Project preserves the natural landscape and minimizes conflict with any present or future planned land use.

### **4.3 Visual Resources**

This section examines the visual and aesthetic impacts on scenic, recreational, and historical areas from the construction and operation of the Project; it identifies and examines the visual resources and the visual qualities of the landscape study area within a three-mile radius of the Project.

#### ***4.3.1 Existing Landscape Quality***

There are limited visual and recreational resources in proximity to the Project. The Project is located approximately 0.2 mile east of the Village of Norwich, 0.7 mile southeast and east of the Village of Bainbridge, and 0.6 mile south and 0.3 mile northwest of the Village of Sidney. Outside of these municipalities, the study area is rural in nature, primarily consisting of agricultural uses (pasture and cultivated crops), forested lands or wooded wetlands, and other open lands and rural residential uses (e.g., hamlets, roadside dwellings).

#### ***4.3.2 Visual Resource Inventory of Historic Areas, Parks, and Preserves***

Visual resources are landscape areas and features that are significant because of either their inherent visual quality or cultural importance, including: naturally occurring landscapes, natural features, designated recreational and scenic areas, and landscapes that demonstrate historical significance.

The NYSDEC's Program Policy, Assessing and Mitigating Visual Impacts – DEP-00-2 (NYSDEC, 2019), identifies 16 categories of aesthetic resources of statewide significance which have been recognized through either national or state designations. These 16 categories were inventoried within a three-mile radius of the Project:

1. A historic resource listed or eligible for inclusion in the State or National Register of Historic Places (NRHP);
2. State Parks (Parks, Recreation and Historic Preservation Law 3.09);
3. New York State Heritage Areas (Parks, Recreation and Historic Preservation Law Section 35.15);
4. The State Forest Preserve (New York State Constitution Article XIV)

5. National Wildlife Refuges (16 United States Code [U.S.C.] 668dd), and State Game Refuges (Environmental Conservation Law [ECL] 11-2015);
6. National Natural Landmarks (36 Code of Federal Regulations [CFR] Part 62);
7. The National Park System (NPS), Recreation Areas, Seashores, Forests (16. U.S.C. 1c);
8. Rivers designated as National or State Wild, Scenic or Recreational (16 U.S.C. Chapter 28, ECL 15-2701 et seq);
9. A site, area, lake, reservoir or highway designated or eligible for designation as scenic, including New York State Scenic Byways (ECL Article 49 Title 1) or NYSDOT equivalent);
10. Scenic Areas of Statewide Significance (Article 42 of Executive Law);
11. A state or federally designated trail, or one proposed for designation (16 U.S.C. Chapter 27 or equivalent);
12. Adirondack Park Scenic Vistas (Adirondack Park Land Use and Development Map);
13. State Nature and Historic Preserve Areas (Section 4 of Article XIV of the State Constitution);
14. Palisades Park (Palisades Interstate Park Commission);
15. Bond Act Properties purchased under Exceptional Scenic Beauty Quality (ECL Article 51, 52 and 56); or
16. National Heritage Areas.

Of the 16 categories of visual resources, Historic Resources, State Forest Preserves, and State or federally designated trails were the only categories of resources identified within the Study Area. In addition to these resource categories, local resources include:

1. Local parks or other significant recreation lands (e.g., village, city, county);
2. Trails (e.g., hiking, snowmobiling, “rails-to-trails”);

3. Community centers (e.g., village or city);
4. Areas dedicated to the preservation of natural features (e.g., wildlife management areas);
5. High volume Average Annual Daily Traffic (AADT) roads of importance; and
6. Schools.

In total, 213 visually sensitive resources were identified within 3 miles of the Project Area. A table summarizing these resources can be found in the JTS Visual Impact Analysis Report (Stantec 2024a) submitted separately from the Application.

#### ***4.3.2.2 Aesthetic Resources of Statewide Significance***

Historic resources identified within the Project Area include properties of historic significance that are listed or eligible for listing on national or state registers of historic places. There were 16 listed sites and historic districts identified, and 115 sites eligible for listing under national or state historic registers. Of these, Schoolhouse No. 5 is within 1,000 feet the Project. Of note regarding the historic districts found within the City of Norwich, Villages of Bainbridge, Sidney, and Unadilla, there are multiple properties (listed and eligible) and other land uses (e.g., parks) that contribute to and are included in the district. The East/West Parks (local parks) and the U.S. Post Office Building (NRHP-listed structure) are found within the boundaries of the Chenango County Courthouse District (Village of Norwich). The Guilford Elementary School Campus (local school) and the Jewell Family Homestead (NRHP-listed structure) are found within the boundaries of the Guilford Historic District.

Six State Forests/Forest Preserves were identified within the Project Area. Of these, the Oak Ridge State Forest, South Hill State Forest and Lyon Brook State Forest are nearest to the Project Area, being located approximately 0.3 mile south, 1.1 miles west, and 1.3 miles west of the Project, respectively.

Several scenic trails are in proximity to the Project Area. The Finger Lakes Trail is 11 feet (at the closest point) north of the Project and is over 1,000 miles in length, extending from the New York-Pennsylvania border (Allegheny State Park) Long Path/Summit of Slide Mountain in the Catskill Forest Preserve. The Chenango Greenway South and North River Trails are located 0.2 mile west

and 0.8 mile north of the Project, respectively. This eight-mile trail network is found along the Chenango River through the City of Norwich.

Other State recreational sites include several NYSDEC boat launch/water access areas in the Towns of Unadilla, Guilford, Norwich, and Sidney.

#### **4.3.2.3 Local Recreation Sites**

There are 74 municipal and state recreation areas found within 3 miles of the Project (refer to Table 4-2, attached, and Figure 2-1). These local recreation areas include municipal parks and municipal and school playgrounds. The Project ROW does not traverse any municipal recreation facilities.

In addition, privately owned recreational areas, such as golf courses and sports complexes, are located within 3 miles of the Project (refer to Figure 2-1). The nearest golf course is approximately 0.5 mile from the Project ROW, in the Town of Sidney.

The visual impact of the Project to these sites will be minimal since the Facilities will be built primarily within and along Existing ROW containing existing transmission facilities, with limited Greenfield ROW required.

#### **4.3.3 Visual Impacts and Mitigation**

Potential visual impacts are greatest when incompatible landscape features or elements are added in a way that detracts from the overall setting or enjoyment of historic, scenic, and recreational resources. Potential visual impacts from the Project are minimized through the use of the Existing ROW and the rebuilding of existing transmission structures with minimal Greenfield ROW necessary. The Project's potential impacts on visual resources were evaluated and the results are summarized in the Jennison Transmission Solution Project Visual Impact Assessment Report (Stantec 2024a).

The potential visibility of the Project and its impact on surrounding areas are dependent on the visibility of the existing infrastructure and the nature and extent of the surrounding development. Generally, structures in the existing transmission corridors proposed to be utilized by the Project are part of a rural or residential setting. A replacement transmission line located in an Existing

ROW has less contrast and less visual impact compared to a new transmission line in an undeveloped area. The Project is proposed to be located primarily within and along Existing ROW, which contain existing transmission or distribution lines, for the majority of the Project length. Additionally, existing transmission and distribution structures are proposed to be removed and replaced with new structures. Proposed structures range from approximately 20 to 65 feet taller than the existing structures, which will result in an increase in visibility. However, the proposed monopole structures are slenderer than the existing H-frame structures and will require less space within the Existing ROW. Additionally, new weathering steel structures will assist with blending the structures into the background or existing vegetation, similar to the current structures. The Site of the Proposed Jennison Substation was also selected to minimize visual impact. The Proposed Jennison Substation is located on a vacant and partially forested parcel of land owned by the Applicant, and a preliminary visual assessment showed that the substation area was not visible from the adjacent roadways. Visual simulations of existing conditions compared to the proposed Project are provided in Figure 4-4 (Photographic Simulations).

#### **4.3.4      *Photographic Simulations***

The digital simulations shown in Figure 4-4 were developed from the identification of visually sensitive resources, viewshed mapping, field verification, and set of viewpoints photographed. Eleven locations were identified that represent the general ranges of viewer sensitivities, landscapes, and land uses. These are locations/viewpoints that:

- Provide open, representative views toward the Project from different directions throughout the study area;
- Represent inventoried aesthetic resources within the study area (if appropriate);
- Illustrate open views of the Project that may be available to representative viewer/user groups within the study area; and
- Illustrate the range of visual effects that could result from the Project, including vegetation removal, view obstruction of Project components (e.g., filtered views), and extent of view.

Twelve visual simulations were completed illustrating the proposed Project in various settings. Three simulations were from locations found along NYS highway routes, eight were located along roadways near residential housing, and one is from Interstate 88. Four locations included visually sensitive resources. Based on the completion of the viewshed mapping, site visit, and the Visual Impact Assessment, it appears the greatest number of people would see the Project while traveling along NYS highways. There is also an increased possibility to view the Proposed structures from the Villages of Bainbridge and Sidney, where the topography is generally flat open lands along the Susquehanna River. The simulations show that there are existing transmission lines within the Existing ROW and that the Project will result in a similar view. The biggest viewshed change is likely to be that the existing wood H-frame structures will be replaced with taller, slender weathered steel monopoles.

Potential discrepancies between the visual simulation and the constructed product may occur due to design revisions, alignment adjustments, and variations between the model surface and ‘real world’ conditions.

#### **4.4 Cultural Resources**

Cultural resources include archaeological sites and objects, historic buildings and structures, and archaeological and historic districts. This section discusses known, previously recorded cultural resources in the Project Area, including the direct effect the Project may have on these resources.

##### **4.4.1 Existing Setting**

Prior to European colonial settlement in the mid-seventeenth century, the land that would become Delaware and Chenango Counties was home to various Indigenous groups (including the Oneida and the Mohawk), dating as far back as 13,000 years before present. Most of the existing transmission lines were constructed in the early 20<sup>th</sup> century. The current landscape surrounding the Project ROW is primarily agricultural fields, residential buildings and scattered commercial and industrial buildings.

#### 4.4.2 *Archaeological Sites*

Consultation with the NYSHPO was initiated via the Cultural Resources Information System on June 14, 2023. In response, NYSHPO issued a formal letter on June 21, 2023, requesting a Phase IA archaeological survey and Phase IB testing recommendations for the Project (see Appendix A – Agency Correspondence). The Phase I Archaeological Survey report with the attached Appendix H: Archaeological Site Avoidance and Phase II Workplan was submitted to NYSHPO via CRIS website on February 9, 2024. NYSHPO reviewed the report and recommended Phase II surveys of sites that could not be avoided. The results of these reports (see EDR, 2024a/b) are summarized below.

Given the large scale of the Project, a research design consistent with the NYSHPO definition of elevated archaeological sensitivity was implemented. This research design included a GIS-based archaeological sensitivity model of the Project Area to provide a more refined assessment of where archaeological sites were likely to be present. The NYSHPO defines areas of elevated archaeological sensitivity as possessing one or more of the following criteria:

- Criterion 1: Within 100 meters of permanent water (rivers, streams, wetlands, ponds and lakes, and hydric soils) and on slopes equal to or less than 12%.
- Criterion 2: Within or near known archaeological sites.
- Criterion 3: Locations of standing or demolished historic structures.

The APE of the Project was approximately 279 acres. The GIS-based sensitivity model resulted in the identification of approximately 198 acres of elevated archaeological sensitivity within the Project Area. This acreage does not include areas that have been previously surveyed or areas that the NYSHPO has previously deemed as not sensitive, as no additional survey is expected to be required in those areas. Excluding these areas, approximately 43 acres of the APE was considered as having elevated archaeological sensitivity.

A Phase I archaeological survey was conducted within those portions of the APE categorized as possessing elevated archaeological sensitivity. Phase I archaeological survey methods consisted of shovel test pit excavations.

Fieldwork for the Phase I archaeological survey was conducted between August and December 2023. In total, personnel excavated 580 shovel test pits at 15-meter intervals in areas of elevated archaeological sensitivity and map-documented structure locations within the APE. For the purposes of organization, 133 survey areas were designated based on the nearest overhead utility structure location or Project component. The Phase I survey was conducted within the approximately 43 acres of the APE with elevated archaeological sensitivity, resulting in the identification of six archaeological sites, which included one historical mill dam site and five indigenous archaeological sites. The integrity of the sites has been moderately impacted by plowing and the construction of Existing Line 946. The results of the archaeological Phase IA survey and Phase IB testing are included in the Phase I Archaeological Survey Report (EDR 2024).

Of the six archaeological sites identified during the Phase I survey, five sites – 946.074-1, 946.075-1, 946.076-1, 946.092-1, and 946.095-1 – were unevaluated for their eligibility for inclusion in the S/NRHP. Avoidance of the sites is not feasible due to ROW constraints and engineering design; therefore, Phase II site examinations were conducted to evaluate their eligibility. The results of the Phase II study showed low to moderate density and relatively limited diversity of the archaeological deposits and no features within the APE of the sites. Based on these results, these sites are ineligible for listing on the S/NRHP and no further avoidance or archaeological investigation was recommended. Archaeological monitoring during ground disturbing activities was recommended, and timber matting will be used during construction throughout the APE outside of the excavation footprints of the transmission pole structures. The results of the archaeological Phase II testing are included in the Phase II Archaeological Investigations Report (EDR 2024).

The remaining mill dam site (946.017) was included in Appendix H: Archaeological Site Avoidance Plan of the Phase I report. However, upon review of the Phase I report, NYSHPO did not concur that the site was fully avoided and requested amendments to Appendix H and submittal as a standalone report (see EDR 2024c: Archaeological Avoidance Plan). The avoidance plan proposes use of an off-ROW access road approximately 500 feet east of the site. Timber matting will be used during construction and no ground disturbing activities will be conducted within the APE of the dam site.

NYSHPO issued a no-effect letter on July 4, 2024 for all sites identified in the Phase II report and concurred that none of the sites were eligible for S/NRHP listing (see Appendix A – Agency Correspondence).

If unanticipated archaeological resources are encountered during construction, the Project's Unanticipated Discovery Plan will include provisions to stop all work in the vicinity of the archaeological finds until those resources can be evaluated and documented by an archaeologist.

#### **4.4.3 National Register of Historic Places**

A preliminary desktop review of the New York State and National Register of Historic Places showed 1,200 historic properties that are listed or eligible for listing within 3 miles of the Project (see Table 4-3, attached, and Figure 2-1). There are 126 evaluated historic architectural properties within one mile of the Project. Of these properties, 11 are listed on the NRHP and 40 have been determined eligible for listing on the NRHP; one of the listed resources is also a contributing resource to the Chenango County Courthouse Historic District. Of the remaining 75 resources, 72 are contributing to Historic Districts. There are two resources within the Broad Street-Main Street Historic District that are individually eligible but are non-contributing to the district. There is one resource that is eligible but non-contributing to the Bainbridge Historic District. There are four Historic Districts within one mile of the Project. Of the 126 resources, 14 individual resources and portions of all four historic districts are within the APE.

A visual effects map was created for the Historic Structures Assessment Report (Stantec 2024b), along with tax parcel data research, to identify unrecorded resources which met the age criteria for survey. All newly identified resources within the APE were evaluated for potential NRHP eligibility. The survey evaluated 18 individual previously recorded resources, portions of four previously recorded historic districts, and 38 newly identified resources within the APE. Fourteen of the previously recorded resources were recommended to retain their NRHP eligibility, listing, or contributing resource status. Of the 38 newly identified resources, 11 were recommended as eligible or potentially eligible for NRHP listing.

A visual effects evaluation was conducted for the 18 previously recorded NRHP-listed and eligible resources and for the 11 newly recorded resources recommended as eligible or potentially eligible for listing. The visibility of the existing transmission line for the resources was low based on the visual effects of computer modeling. The modeling also indicated that overall, the visibility of the proposed structures would also be low for each resource and would not significantly change the resource's viewshed or compromise the integrity for which the resources were listed or eligible for listing in the NRHP. The results of this visual effects evaluation are included in the Jennison Transmission Solution Project Visual Impact Assessment Report (Stantec 2024a).

NYSHPO issued a no-effect letter on June 12, 2024 for all sites identified in the Historic Structures report and concurred that none of the sites were eligible for S/NRHP listing (see Appendix A – Agency Correspondence).

#### ***4.4.3.1 Cultural Impacts and Mitigation***

Approximately 198 acres or 17% of the Project Area overlap buffer zones classified by the NYS SHPO as archaeologically sensitive. These buffer zones represent areas around archaeological sites that are recorded by SHPO. Because these areas are only based on proximity to documented sites, locations within these areas may not necessarily be archaeologically sensitive, and locations outside these areas may also be archaeologically sensitive. SHPO evaluates archaeological sensitivity based on a variety of environmental factors, including topography and hydrology, so these buffer areas are only preliminary and suggestive. As much of the Project is proposed within Existing ROW and transportation corridors, there is a low archaeological sensitivity for the Project.

Nevertheless, upon determination of a final alignment and during the development of the EM&CP, NYSEG will coordinate, as appropriate, with the OPRHP, which acts as the SHPO, to reduce, eliminate or mitigate impact, where applicable. These mitigation measures will be shown in the Project design drawings included in the EM&CP.

## 4.5 Terrestrial Ecology and Wetlands

This section summarizes the potential effects to ecological and wetland resources anticipated as a result of Project construction, operation, and maintenance activities. This section also identifies measures to avoid or minimize these potential impacts. An initial desktop analysis was performed for the Project using existing information from federal and state agency databases and state agency correspondence to ascertain the presence of biological and natural resources likely to occur in the vicinity of the Project (See Appendix A – Agency Correspondence).

Predominant vegetation communities were characterized during site visits by biologists according to the ecological classifications as described in *Ecological Communities of New York State* (Edinger et al., 2014).

The presence of potentially jurisdictional wetlands and other waters of the United States were determined based on a review of existing information from the USFWS NWI mapping (USFWS, 2023c), and NYSDEC Freshwater Wetland mapping (NYSDEC, 2024c).

The NWI wetland database identifies potential wetland areas based on interpretation of remotely sensed aerial imagery with limited field verification. NWI-mapped features may often coincide with state-regulated wetlands and surface water features. Current aerial imagery, the USGS National Hydrography Dataset (USGS, 2023), and the NRCS Soil Survey for Delaware and Chenango Counties, New York (USDA-NRCS, 1973) were used to supplement the review of wetland maps to identify potential wetland areas.

### 4.5.1 *Ecological Community Cover*

The Project primarily runs within and along Existing ROW and transportation corridors. Several waterways, including the Susquehanna River, are crossed by the Project at various locations. Wetland communities, such as PEM and PSS wetlands, common reed marshes, and artificial ponds, are scattered throughout the Project Area. Upland communities, such as brushy cleared land, cropland/row crops, mowed land/mowed lawn with trees, mowed roadside, and paved road/path are commonly found throughout the Project Area. Table 4-4 (attached) provides a cumulative summary of ecological communities, as defined by *Ecological Communities of New*

York State (Edinger et al., 2014), within the Project ROW which is of varying width as shown on design plans in Exhibit 5.

#### **4.5.2 Invasive Species**

The presence of invasive plant species is a common occurrence along transmission line ROWs and other utility and transportation corridors. Field surveys were completed throughout the Existing ROW in October 2022 and May-July 2023 to identify and document areas where invasive plant species were prevalent.

Commonly observed invasive plant species within the Project ROW included Morrow's honeysuckle (*Lonicera morrowii*), multiflora rose (*Rosa multiflora*), reed canary grass (*Phalaris arundinacea*), autumn olive (*Elaeagnus umbellata*), garlic mustard (*Alliaria petiolata*), mugwort (*Artemisia vulgaris*), and Canada thistle (*Cirsium arvense*). Less commonly observed invasive species included glossy buckthorn (*Frangula alnus*), Japanese knotweed (*Reynoutria japonica*), purple loosestrife (*Lythrum salicaria*), Tatarian honeysuckle (*Lonicera tatarica*), common reed (*Phragmites australis*), and Japanese barberry (*Berberis thunbergii*).

A total of 383 non-native invasive species occurrences were observed during the 2022-2023 baseline invasive plant surveys. Morrow's honeysuckle was the most observed species accounting for 40% (N = 150) of all observed occurrences. Multiflora rose, reed canary grass, and autumn olive were the next most common invasive plant species, with a combined average of 41% (N = 84, N = 39, N = 34, respectively) of all observed occurrences. All other invasive plant species had fewer than 80 observed occurrences. The occurrence and observed density of invasive plant species is shown on the Invasive Species Locations Maps. Representative photographs of the different species observed during surveys are included in the Invasive Species Report. Invasive species were found throughout the Existing ROW. Existing populations of invasive plants often are transported or spread through disturbance activities. An invasive species management and control plan will be developed during the EM&CP phase to prevent the spread of invasive species both within and from the Project ROW.

### **4.5.3 *Terrestrial Ecology Impacts and Mitigation***

Based on field review results of the Project ROW, the estimated acreage of wooded cover types that would potentially be removed as a result of the Project is approximately 142 acres. The long-term conversion of existing forested communities to managed grassland or shrubland may occur as a result of construction and maintenance of the Project. Work within the Project ROW will require the permanent removal of trees and other vegetation, while access road improvements and other construction activities will require the clearing of undesirable woody species and/or saplings. All tree clearing removal and forest conversion will be kept to the minimum width necessary to avoid vegetation interference during construction and operation and will be identified during final design and included in the EM&CP. No herbicides or pesticides will be used during the construction phase to clear unwanted vegetation. Mitigation measures such as the use of tracked equipment, low-ground-pressure equipment, and mats will be used in environmentally sensitive areas including streams and wetlands. Additionally, erosion and sediment control measures to maintain and protect soils and water resources will be determined for areas where soil disturbance occurs. The above measures, along with clearly demarcated work areas, will be used to protect vegetation and topsoil not cleared from damage due to Project construction and operation activities.

### **4.5.4 *Wetlands***

Federal and state agencies, including the NYSDEC and USACE, protect wetlands and other waters through regulation and permitting activities.

#### **4.5.4.1 *NYSDEC-Regulated Wetlands***

Wetlands greater than 12.4 acres or wetlands of any size that possess unique qualities are regulated by NYSDEC pursuant to Environmental Conservation Law Article 24. Additionally, wetland adjacent areas, defined as those areas of land or water that are outside a formal wetland boundary but within 100 feet of the wetland boundary are also regulated by NYSDEC.

Wetlands shown on New York State's freshwater wetlands map are classified according to their ability to perform specific wetland functions and provide wetland benefits. Class I wetlands have the highest rank, and the ranking decreases from Classes II through IV. New York State assigns a cover class based on the cover type that constitutes at least 50% of the wetland area (NYSDEC, 2024c).

NYSDEC ERM freshwater wetland mapping indicates there is one state-regulated wetland within the Project Area (Wetland FR-7; see Figure 4-5) totaling approximately 1.9 acres within the Project ROW (NYSDEC, 2024c). A summary of NYSDEC-mapped streams within the Project area can be found in Table 4-5 (attached).

#### **4.5.4.2 USACE-Mapped Wetlands**

The USACE has regulatory jurisdiction over wetlands and other waters of the United States pursuant to Section 404 of the CWA. USFWS NWI maps were used to identify potential existing wetlands within the Project Area. NWI mapping employs the Cowardin classification system (1979) to classify wetland cover types. Many wetlands include more than one cover type, so a wetland is classified based on the most abundant cover type in the wetland. A wetland is assigned multiple cover types if each cover type encompasses 30% or more of an entire wetland complex. According to NWI mapping, the Project Area contains 36 lacustrine/palustrine/riverine wetlands totaling approximately 24.1 acres. See Figure 4-5 (USFWS NWI and NYSDEC Mapped Wetlands) for the location of the NWI-mapped wetlands.

#### **4.5.4.3 Delineated Wetlands**

Field delineation of wetlands and streams took place in October 2022 and May-July 2023. Results of those investigations, contained in a Wetland Delineation Report, identified the presence of 145 wetlands occupying approximately 108 acres within Project ROW. Table 4-6 and 4-7 (attached) summarize the results of the individual wetlands and streams identified and Figure 4-6 (Delineated Wetlands and Streams) shows the locations of the delineated wetlands and streams.

#### **4.5.4.4 Wetland Impacts and Mitigation**

Potential effects to wetland resources may occur directly or indirectly during Project construction and operation. Mitigation strategies will be utilized to address short-term (temporary), and any possible permanent wetland impacts that could occur during construction. Sediment and erosion control methods will also be implemented, which may include silt fencing, use of equipment mats, and planting/seeding/mulching of exposed soils, to prevent soil erosion and sedimentation in nearby wetlands and surface waters due to runoff.

Wetland disturbance will be minimized by staging construction materials outside of wetlands and, whenever possible, utilizing equipment mats when moving equipment in wetlands. In addition, existing access roads will be utilized, whenever possible. When existing access roads are not an option, access roads will generally be temporary, and the area will be restored to pre-construction condition following completion of work in the area. All mitigation strategies, erosion and sediment control techniques, and temporary and permanent access roads will be identified during final design, and will be included in the EM&CP.

#### **4.6 Wildlife**

The Project is in the Northeastern Forage and Forest Land Resource Region. The entire Project is within the Glaciated Allegheny Plateau and Catskill Major Land Resource Area (MLRA 140). The Project and its surrounding area consist of a mix of agriculture, hardwood and conifer forestland, and rural residential land uses. Elevations within the study area range from slightly less than 1,000 feet AMSL in the portions of the Project in Norwich and Sidney, to slightly above 2,000 feet AMSL on the eastern end of the Project.

Wildlife habitats in Chenango and Delaware Counties are largely associated with primary ecological communities including rural agricultural; suburban residential; upland forests; successional communities, and wetland/riparian areas. Table 4-8 (attached) summarizes the representative wildlife that can reasonably be expected to be found within the Project area.

##### **4.6.1 Rural Agricultural Communities**

Active farming in rural areas within the Project Area provides vegetative cover and food for a wide variety of native fauna including white-tailed deer (*Odocoileus virginianus*), wild turkey (*Meleagris gallopavo*), raccoon (*Procyon lotor*), and woodchuck (*Marmota monax*). Farm fields that are interconnected with brushy hedgerows serve as wildlife corridors for other species including the eastern gray squirrel (*Sciurus carolinensis*), eastern chipmunk (*Tamias striatus*), and eastern cottontail (*Sylvilagus floridanus*). Waste grain left within agricultural fields after harvesting provide a crucial winter food source for migratory waterfowl including the Canada goose (*Branta canadensis*) and mallard (*Anas platyrhynchos*).

#### **4.6.2 Suburban Residential Developed Communities**

Land use practices including residential developments and railroad, road, and utility corridor maintenance have extensively modified and/or fragmented existing wildlife habitats within the Project Area. Wildlife species composition and abundance within the Project Area varies based on factors such as habitat size and adjacent land cover. A greater diversity and number of animal species often reside in transition areas between different ecological communities, such as shrubby corridors between residential properties or the Project Area, or established forest. Amphibians and reptiles likely to occur in transition areas include the eastern American toad (*Anaxyrus americanus*), eastern garter snake (*Thamnophis sirtalis*), and eastern milk snake (*Lampropeltis triangulum*).

Birds commonly found in these types of habitats include red-winged blackbird (*Agelaius phoeniceus*), mourning dove (*Zenaida macroura*), rock dove (*Columba livia*), European starling (*Sturnus vulgaris*), and house sparrow (*Passer domesticus*).

#### **4.6.3 Successional Upland Forest Communities**

Upland forest communities within the Project Area provide habitat for wildlife species that favor forest edge conditions, such as the blue jay (*Cyanocitta cristata*), northern cardinal (*Cardinalis cardinalis*), American goldfinch (*Spinus tristis*), dark-eyed junco (*Junco hyemalis*), tufted titmouse (*Baeolophus bicolor*), black-capped chickadee (*Poecile atricapillus*), and several woodpecker species (hairy [*Leuconotopicus villosus*], downy [*Picoides pubescens*], and pileated [*Dryocopus pileatus*]). Some migratory shorebird species found in early successional, shrubby areas within the Project Area include the American woodcock (*Scolopax minor*). Other common birds such as the turkey vulture (*Cathartes aura*), wild turkey, and red-tailed hawk (*Buteo jamaicensis*) are likely present. Common mammals that utilize forested habitats and likely occur within the Project Area include the eastern gray squirrel, red squirrel (*Sciurus vulgaris*), eastern chipmunk, white-tailed deer (*Odocoileus virginianus*), raccoon, red fox (*Vulpes vulpes*), eastern coyote (*Canis latrans*), woodchuck (*Marmota monax*), little brown bat (*Myotis lucifugus*), and opossum (*Didelphis virginiana*).

#### **4.6.4 Successional Communities**

Successional community types, such as successional shrubland, provide nesting and escape cover for a variety of wildlife species. Various songbirds, such as the northern mockingbird (*Mimus polyglottos*), American goldfinch, northern cardinal, cedar waxwing (*Bombycilla cedrorum*), and white-throated sparrow (*Zonotrichia albicollis*), require low brushy vegetation for nesting, rearing young, and coverage for escape. Common mammals typically found in these types of brushy successional habitat include the white-tailed deer and eastern cottontail.

Raccoon (*Procyon lotor*) and striped skunk (*Mephitis mephitis*) are especially common in this type of successional forest, due to its proximity to wetland/riparian areas where their primary forage occurs. Common reptiles and amphibians that may occur in successional habitats include a variety of frogs and snakes. In addition, some of the shrub species found in these areas produce berries, which provide a quality food source for many birds and mammal species.

#### **4.6.5 Palustrine Open-Water (PUB) Wetland Communities**

The PUB wetlands located throughout the Project Area provide habitat for waterfowl, including the Canada goose (*Branta canadensis*) and a variety of duck species (i.e., mallard [*Anas platyrhynchos*], green-winged teal [*Anas carolinensis*], and wood duck [*Aix sponsa*]). Other common wetland bird species likely to inhabit areas within the Project Area include the great blue heron (*Ardea herodias*), green heron (*Butorides virescens*), and belted kingfisher (*Megaceryle alcyon*).

#### **4.6.6 Shallow/Deep Emergent Marsh Wetland Community**

Some quality wetland/aquatic habitats exist within the shallow and deep emergent marshes found throughout the Project Area. These areas provide a source of food, water, and cover to a variety of waterfowl and many of the upland species mentioned previously. These communities also may support amphibians and a diversity of insects and aquatic invertebrates. They are preferred foraging areas for aerial insectivores, including songbirds and bats. In addition, these communities provide habitat for various wetland/aquatic wildlife species, such as Canada goose, mallard, wood duck, and reptiles such as painted turtle (*Chrysemys picta*), green frog (*Lithobates clamitans*),

northern leopard frog (*Lithobates pipiens*), spring peepers (*Pseudacris crucifer*), bullfrog (*Lithobates catesbeiana*), and eastern American toad.

#### **4.6.7 Stream Communities**

Forty-eight streams cross the Project Area. These streams contain sufficient bottom substrates, dissolved oxygen, depth, water temperature, and flow rate to describe a canal, ditch or artificial intermittent streams and natural intermittent or unconfined riverine community types. These community types include various freshwater aquatic vegetation and wildlife species including creek chub (*Semotilus atromaculatus*), central mudminnow (*Umbra limi*), white sucker (*Catostomus commersonii*), rock bass (*Ambloplites rupestris*), common carp (*Cyprinus carpio*), bluegill (*Lepomis macrochirus*), pumpkinseed (*Lepomis gibbosus*), and yellow perch (*Perca flavescens*).

#### **4.6.8 Wildlife Impacts and Mitigation**

Wildlife species and habitat occurring within the Project Area are common throughout Chenango and Delaware Counties. Most of the Project is proposed to be sited within and along Existing ROWs and transportation corridors. The level of impacts associated with the limited expansion of the Existing ROW and limited establishment of Greenfield ROW is expected to result in a minimal change in the structure and function of wildlife habitat within the Project Area.

Project construction and maintenance will likely result in wildlife species temporarily seeking suitable habitat in adjacent areas. Those species preferring edge and early successional habitats are expected to return following Project construction and restoration activities. The greatest impact to wildlife is expected to occur in those limited areas where forested communities will be permanently converted to other community types (e.g., successional forest, shrubland, emergent marshes, etc.). Although some species would benefit from an increase in early successional and edge habitats, species that require forest cover types for food, shelter, and nesting may be adversely affected. It is also possible that early successional habitat would provide new foraging corridors for predatory species.

## 4.7 Threatened and Endangered Species

Section 7(a) of the Endangered Species Act includes a national program, headed by the USFWS, focused on the conservation of threatened and endangered species and their respective habitats.

A literature review was conducted to determine the conservation status and distribution of local and migrant wildlife species that may occur within the Project Area. Informational sources included published literature and USFWS and NYSDEC databases. The USFWS Federally listed Threatened and Endangered Species IPaC service was consulted for the presence of federal-listed species (USFWS, 2023b). Additionally, correspondence was exchanged with the NYSDEC Division of Fish and Wildlife and NYNHP concerning the documented presence of listed species and sensitive or unique ecological habitats that may occur within the Project Area (See Appendix A – Agency Correspondence).

The USFWS New York field office publishes Federal-listed Threatened and Endangered Species and Candidate Species County Lists regarding the occurrence of federally protected species, which is available through the IPaC service. An IPaC Official Species List, obtained on August 11, 2023, identified the federally endangered NLEB (*Myotis septentrionalis*) and the federal Candidate monarch butterfly (*Danaus plexippus*) as potentially occurring in the Project Area. One critical habitat was identified within the Project Area – the Susquehanna River, which is critical habitat for the green floater (*Lasmigona subviridis*) (see Appendix A – Agency Correspondence).

On June 27, 2023, a letter request was submitted to the NYNHP for information regarding the presence of threatened and endangered species and unique natural communities within the Project Area. As further discussed in Section 4.7.1, in a response letter dated August 17, 2023, the NYNHP responded that they had records of the state-listed bald eagle (*Haliaeetus leucocephalus*) and brook floater (*Alasmidonta varicosa*) within the Project Area. The hellbender (*Cryptobranchus alleganiensis*), a NYS species of Special Concern, was also identified in the Project Area (see Appendix A – Agency Correspondence).

The Applicant will continue to coordinate with federal and state agencies to identify and mitigate any additional potential adverse effects to threatened and endangered species identified through EM&CP development and construction.

#### **4.7.1 Threatened Species**

##### **4.7.1.1 Northern Long-eared Bat**

The NLEB is a federal- and state-listed Endangered species of bat found in forests throughout New York State. It was identified on the IPaC Official Species List as potentially occurring in the Project Area. These bats utilize a diversity of forest habitats for roosting, foraging and raising young. In general, any tree large enough to have a cavity or that has loose bark may be utilized by NLEB for roosting or rearing young. Recent declines in population have been primarily due to a disease known as white-nose syndrome and not due to loss of habitat. As such, removal of trees from the landscape is not generally considered harmful unless bats are within the trees at the time of their removal. Additional correspondence received from NYSDEC, dated March 5, 2024, included proposed seasonal tree clearing restrictions, with clearing limited to November 1<sup>st</sup> through March 31<sup>st</sup>, to the extent practicable (See Appendix A – Agency Correspondence). Additionally, if at any time during Project construction, any NLEB maternity roost trees are discovered within any Project Segment, NYSDEC and USFWS will be notified within 24 hours of discovery and an area that is at least 150 feet in radius around the maternity roost tree will be marked and avoided until notice to continue work at the site is granted by NYSDEC and USFWS.

##### **4.7.1.2 Brook Floater**

The brook floater is a threatened species in New York State but is not listed or protected on a federal level. Brook floaters are a freshwater mussel species that are, like many freshwater mussels, increasingly imperiled due to changing river conditions. Sedimentation, fertilizer runoff, dams, habitat destruction and invasive species all present threats to mussels. Populations of brook floaters have dramatically declined in New York since the 1950s and have largely disappeared from the Susquehanna River, but limited populations have been documented in tributaries of the Susquehanna River basin (NYNHP, 2024). Upon further correspondence with the NYSDEC (See Appendix A – Agency Correspondence), no specific protection measures were suggested for the species. Seasonal work restrictions for fish and Article 24 protections will still apply.

#### **4.7.1.3 Bald Eagle**

The bald eagle is a threatened species in New York State. While the bald eagle was federally delisted from threatened status under the Endangered Species Act in 2007, it remains federally protected under the Bald and Golden Eagle Protection Act.

Bald eagles typically nest in large trees near large bodies of water. Adults tend to use the same breeding area and often the same nest each year (NYSDEC, 2024a). NYNHP coordination clarified that breeding bald eagles have been documented within 100 yards of the Project Area in the Town of Bainbridge and within one mile of the Project Area in the Town of Sidney. A field survey conducted on November 8, 2023, found evidence of an eagle nest approximately 500 feet north of the Project ROW. Additional correspondence with NYSDEC (See Appendix A – Agency Correspondence), includes proposed seasonal work restrictions within 0.25 mile of the nest between January 1<sup>st</sup> and September 30<sup>th</sup>. If blasting were to occur (though it is not anticipated) the setback is required to be no less than one mile from the nest and must be detailed in an applicable blasting plan.

#### **4.7.2 Rare Species/Species of Conservation Concern**

##### **4.7.2.1 Eastern Hellbender**

The eastern hellbender (*Cryptobranchus alleganiensis*) is a Species of Special Concern in New York State. NYNHP correspondence (See Appendix A – Agency Correspondence) indicated that it is known to exist within 0.5 mile of the Project Area in the Susquehanna and Unadilla Rivers. In New York, the hellbender is found solely in the Susquehanna and Allegheny River drainages, including their associated tributaries. While there is limited historical population data, available evidence suggests that the current population is declining. Among the explanations that have been suggested to account for this apparent decline are pollution of the aquatic habitat, damming of rivers and streams, and the siltation of streams and rivers resulting from agricultural practices and construction work (NYSDEC, 2024b).

This species may be found in the rivers, creeks, or streams that are within the Project Area. Project-related construction is proposed to traverse various waterbodies including the Susquehanna River, and the potential for the Project to impact these species will be mitigated with the implementation of appropriate erosion and sediment controls, as well as other standard stream protection measures.

No seasonal work restrictions were recommended by the NYSDEC beyond those required for fish, in which all work in state-regulated streams is prohibited from March 1 through July 31 in warm water fisheries.

#### **4.7.2.2 *Monarch Butterfly***

The monarch butterfly (*Danaus plexippus*) is a candidate for federal listing. It was identified on the IPaC Official Species List as potentially occurring in the Project Area. Monarch Butterflies breed and summer in New York before migrating south for the winter and utilize habitat with flowering plants, laying their eggs exclusively on milkweed (*Asclepias spp.*), USFWS 2023a).

As the Monarch Butterfly is currently a candidate species only, it does not receive any legal protections afforded by the Endangered Species Act. As a result, impact to suitable habitat as a result of the Project is not currently prohibited, restricted, or regulated in any manner. Therefore, no further assessment of the Project Area for Monarch Butterflies was deemed warranted. Furthermore, the Project, as designed, is not anticipated to have a significant impact on Monarch Butterfly habitat. Consequently, no significant or adverse impact to existing populations of Monarch Butterflies is anticipated in connection with the Project.

#### **4.7.3 *Threatened and Endangered Species Effects and Mitigation***

Given the possibility for impacting federal or state-listed species, consultation is ongoing with the NYSDEC and USFWS regarding mitigation measures to be implemented in the EM&CP to minimize impacts to protected species. At a minimum, time-of-year tree clearing, and stream disturbance limits may be imposed, and the observation of any threatened or endangered species during work on the Project will result in notification to the NYSDEC and USFWS and could involve a stop work directive in the immediate area.

## **4.8 Topography and Soils**

### **4.8.1 Topography**

Surficial topography along the Project ROW is varied. The land surface is transected by creeks, rivers, and tributaries that generally flow to the Susquehanna River. Based on the Google Earth Terrain Model, Project ROW elevations range from approximately 960 feet AMSL to 2,170 feet AMSL. The Project Area has an average elevation of approximately 1500 feet AMSL and an average slope of 3% (Google Earth, 2024). The Project ROW does not cross or follow any significant ridge lines or high points and avoids steep slopes to the maximum extent possible while following Existing ROW. As such, the Project is not expected to result in any significant permanent or temporary impacts to topography.

### **4.8.2 Geology**

The USDA-NRCS Soil Survey of Delaware County (USDA-NRCS, 2006) states that the Project Area within Delaware County is in the Allegheny Plateau physiographic province. The bedrock underlying all of Delaware County is of sedimentary origin that is a result of mountain erosion and is of the Upper Devonian period. The bedrock underlying the Project Area includes black shales of the Genesee group; Cashauqua and Middlesex shale and siltstone of the Sonyea group; and Angola and Rhinestreet shale of the West Falls group.

The USDA-NRCS Soil Survey of Chenango County (USDA-NRCS 1985) states that the Project Area within Chenango County is in the Allegheny Plateau physiographic province. The bedrock underlying Chenango County is of the Middle and Upper Devonian periods. The bedrock underlying the Project Area consists of shale and siltstone of the Genesee Group and Cashauqua shale and siltstone of the Sonyea Group.

The surficial geology within the Project Area is Pleistocene-aged glacial till consisting of poorly sorted, variable mixture of silt, clay, sands, and coarse fragments of varying sizes. This material was deposited by the Laurentide Ice Sheet during the Wisconsin stage of glaciation.

The Project is adjacent to two active mines/gravel pits (NYSDEC Division of Mineral Resources, 2019).

The Kelly Sand and Gravel Mine (Mine ID 70505) is located off State Highway 8 near Kelly Road in the Town of Bainbridge within Existing Line 946 ROW. The Proposed Line 946 ROW diverts to the west to avoid the mine and is not expected to impact the facility's operations.

The Knowles Mine (Mine ID 70901) is located west of County Road 36 in the Town of Guilford, approximately 775 feet west of the Project ROW near the future site of the North Pond Substation. There is an access road to the mine that crosses the Project ROW.

According to the NYSDEC Environmental Resource Mapper, there are eight Unique Geological Features located within 3 miles of the Project (NYSDEC, 2024c). The presence of a unique geological feature or landform near a Project does not trigger a NYSDEC regulatory requirement and these features will not be negatively affected by construction-related activities as they are not within the Project Area.

#### **4.8.3 Soils**

A review of USDA-NRCS Soil Surveys of the Project Area was completed to document the soil types/associations mapped within the Project Area. Soil survey data for soils mapped within and along the Project ROW in Delaware and Chenango Counties were compiled and are summarized below and in Table 4-9 (attached).

According to the NRCS Web Soil Survey (Soil Survey Staff, 2021), depth to bedrock within the Project Area averages greater than 200 centimeters, except for arnot channery soils (AsB; 43 cm), Greene soils (GrB; 86 centimeters), Lordstown soils (LoB, LoC, LoD, LoE, LrE, LrF; 61-76 cm), Oquaga soils (OaB, OaC, OpC; 61-76 cm), Tuller channery soils (Tu; 43 cm), Halcott soils (HcC, HcE; 6 cm), Mongaup soils (MkB, MnB, MnC, MnD; 71-89 cm), and Vly soils (VIB, VIC; 79 cm). See Figure 4-7: Soil – Depth to Bedrock. The majority of soils found within the Project Area are classified as 'Not Hydric' (see Figure 4-8: Soil Hydric Rating).

Of the soils mapped within and along the Project ROW, 19 are classified as *Prime Farmland*, two are classified as *Prime Farmland if Drained*, 46 are classified as *Farmland of Statewide Importance*, and 45 are classified as *Not Prime Farmland*, as defined by the USDA-NRCS (see Figure 4-9: Soil Farmland Classification). However, these soils do not necessarily correspond to active agricultural areas. Instead, the soils meet certain physical and chemical criteria including

soil properties, growing season, and moisture supply needed to produce sustained high yields of crops when treated and managed according to acceptable farming methods (USDA-NRCS 2023). As proposed, the Project ROW traverses areas of active and fallow agricultural lands. Upon determination of a final alignment and during the development of the EM&CP, NYSEG will coordinate with NYSDAM and associated farm owners/operators to reduce, eliminate, or mitigate impact, where applicable. These mitigation measures will be shown in the Project design drawings included in the EM&CP.

#### **4.8.4      *Geological Impacts and Mitigation***

Blasting is not anticipated or currently planned for the construction of the Project. However, field conditions may require the use of blasting in a limited and controlled fashion if other construction techniques are not practical. If necessary, a blasting plan would be included in the EM&CP. Excavations will be limited to structure installations. Therefore, it is anticipated the Project will not result in cumulative effects relative to topographic and soil conditions.

Extensive alterations of slope and gradient are not anticipated in the Project Area. Minor changes to topography will occur due to grading in work areas and construction or improvement of access roads. The Project will be designed and constructed to be compatible with onsite geologic conditions. No geologic or environmental concerns exist that would have a long-term effect on the integrity of structures, as demonstrated by the long-standing presence of existing electric line structures within or adjacent to the Project ROW. To mitigate temporary impacts, disturbed soils will be re-graded to pre-construction elevations. Soil erosion and sediment controls will be implemented during construction activities.

Based upon the foregoing, the Project is not expected to result in any permanent or temporary significant impacts to soils.

## **4.9 Water Resources**

This section provides an assessment of the Project's potential effects to water resources. Efforts undertaken to avoid or minimize these potential impacts, as well as mitigation practices, will be identified to address unavoidable impacts. These mitigation measures are described in Section 4.9.2 and will be shown in the Project design drawings included in the EM&CP.

### ***4.9.1 Affected Environment***

A desktop geo-spatial analysis was completed, using the proposed Project ROW, existing information from federal and state agency data sources, and a literature review of published data, to determine the likely presence and extent of water resources in the Project Area. Water resource information was obtained from topographical maps from the NYSDEC Environmental Resource Mapper (NYSDEC, 2024c), which provides information regarding the classifications and standards of quality and purity assigned to the identified surface waters. Existing conditions were field-verified during wetland and stream field work performed in October 2022 and May-July 2023.

#### ***4.9.1.1 Surface Waterbodies***

The western portion of the Project is in the Upper Susquehanna watershed (HUC 020501), and the eastern portion of the Project is in the Upper Delaware watershed (HUC 020401). The average annual precipitation in MLRA 140 is 31 to 68 inches, with most of the precipitation coming in the form of snow, and the freeze-free period ranges from 130 to 200 days (USDA 2022). The primary source of ground water in the region is the glacial outwash deposits in the valleys (USDA 2022).

Major streams within the Project Area include the Susquehanna River, Peckham Brook, Guilford Creek, Moses Brook, Lyon Brook, Johnson Creek, East Brook, and Crystal Brook. Figure 4-10 (NYSDEC Mapped Streams and Surface Waterbodies) depicts the locations of water resources identified within the Project Area, as mapped by the NYSDEC and verified during field investigations performed in 2022 and 2023. Background research included review of *The Proposed Final New York State 2018 Section 303(d) List of Impaired Waters Requiring a TMDL/Other Strategy* (NYSDEC 2020b) to identify waters that do not support specific water uses and that may

require development of a TMDL. Results of this review indicate the following listed impaired waters within the Project Area:

- Individual Waterbody Segments with Impairment Requiring TMDL Development: Cayuga Lake (southern end) – Pollutant: phosphorus; silt/sediment
- Waterbodies for which TMDL Development Are Deferred (Pending Development/Implementation/Evaluation of Other Restoration Measures): Cayuta Lake – Cause/Pollutant: phosphorous

Mapped NYSDEC-classified streams crossing the Project ROW are identified in Table 4-5 (attached) and Figure 4-10 (NYSDEC Mapped Streams and Surface Waterbodies). These classified streams include 6 Class A streams, 2 Class B streams and 36 Class C streams.

As shown in Table 4-7 (attached) and Figure 4-6 (Delineated Wetlands and Streams), the Project ROW crosses 71 delineated streams, including 55 perennial streams, 9 intermittent streams, and 7 ephemeral streams. Three streams are classified as Class A (Standard A[T]), one Class A (Standard A[TS]), two Class B (Standard B), one Class B (Standard B[T], eight Class C (Standard C[T]), three Class C (Standard C[TS]), 30 Class C (Standard C), and 23 Class D.

#### **4.9.1.2 Stormwater Management**

Generally, stormwater runoff from construction of an electric transmission line ROW is via overland flow, and few structural measures are needed to control stormwater discharges. Temporary BMPs to control stormwater runoff during construction activities may include silt fence, construction matting, and erosion control blankets. Such measures, to be implemented until final stabilization of the Project Area is complete, will be provided on a site-specific basis as detailed in the EM&CP.

#### **4.9.2 Water Resource Effects and Mitigation**

Water basins and watercourses are protected by the USACE, which has regulatory jurisdiction over Navigable Waters of the United States, pursuant to Section 10 of the 1899 Rivers and Harbors Act, and other jurisdictional waters of the United States (lakes, rivers, streams, and wetlands), pursuant to Section 404 of the CWA.

Since the Project will be installed on overhead lines exclusively, structures will be located to span streams within the Project ROW. Furthermore, structure placement will avoid the discharge of fill material to jurisdictional wetlands to the extent practicable. The use of explosives is not proposed for any portion of the Project, so no provisions need be made to protect fish and other aquatic life from harm from the use of explosives or pollutants in or near streams and other bodies of water. However, in the event that blasting is required near streams or other bodies of water, such activity will be utilized in a limited and controlled fashion, and the Applicant will consult with Staff and NYSDEC regarding appropriate protective measures, and a blasting plan reflecting such measures will be included in the EM&CP.

Project impacts to surface waters could potentially result from clearing and grading in areas adjacent to, within, and downstream of the Project ROW. Clearing activities will also extend beyond the Project ROW where danger tree removal is necessary. Small spills, including diesel and gasoline fuels, lubricating oils, and cooling fluids, may result from operation of construction equipment and vehicles. All spills will be reported and cleaned up in accordance with the applicable regulations. A spill prevention plan will be included in the EM&CP.

Vehicular access across streams and other watercourses will be avoided, to the extent possible. Stream crossings will take place where existing stream crossings are available, to the extent possible. Factors used to determine the appropriate crossing type to be installed at each location include channel characteristics; stream bottom substrate; stream gradient and flow; riparian vegetation; resource value; assessment of erosion potential; and an estimate of potential stream flow at the time of construction. The stream crossing type for each crossing location will be identified on the EM&CP plan and profile drawings. Care will be taken to ensure that stream flow remains uninhibited and to avoid damage to the stream banks during the installation and removal of crossing materials.

Stream crossings will utilize equipment mats and other minimally intrusive bridge materials that are designed to minimize stream bed and bank disturbance and water quality impacts. Where practicable, these materials will be installed at right angles to the stream. Seasonal work restrictions for warm water fisheries will be adhered to. Any potential impacts to streams and other water bodies, such as minor increases in turbidity, would be temporary. Implementation of the

BMPs will ensure that the Project will have only minor impacts on the NYSDEC-classified streams crossings identified in Table 4-5 (attached). Unless otherwise specified in the EM&CP, BMPs will be the design standard and will be maintained in accordance with state guidelines.

In portions of the Project Area where shallow groundwater sources are identified, dewatering may be required during construction activities. Should dewatering be required, a dewatering filter bag will be used, or a temporary sedimentation basin will be created, to receive dewatering effluent. Once filtered and/or settled, clear water will be pumped or allowed to flow onto vegetated upland areas. Straw bales, filter fabric, and other materials, would be used to construct the retention structures and basins. Dewatering plans will be presented in the EM&CP.

Proposed stormwater management practices will effectively minimize and control stormwater runoff to avoid an increase in stormwater runoff volume, erosion, and flood potential within the Project Area. No perceptible increase in stormwater runoff volume is anticipated due to the Project.

Based on the above assessment of potential impacts to water resources and the mitigation measures proposed to be implemented during Project construction, no permanent or significant temporary impacts to hydrology are anticipated.

#### **4.10 Noise**

Operation and maintenance of the Project is not expected to result in significant permanent noise impacts. Temporary noise impacts will result from various Project construction activities.

##### ***4.10.1 State Noise Standards***

NYSDEC published a program policy in 2001 titled *Assessing and Mitigating Noise Impacts*. The NYSDEC policy provides a suggested guideline for determining the threshold for the potential onset of adverse noise impacts. These guidelines assess impact in terms of an allowable incremental increase in noise relative to existing acoustic conditions. The NYSDEC method is based on the perceptibility of a new sound source and identifies limits relative to the existing conditions at the nearest residences or other potentially sensitive receptors (e.g., schools, churches, etc.). In areas not sensitive to noise (i.e., vacant land) the application of the NYSDEC criteria may not be appropriate.

The NYSDEC program policy states that a 0 to 3 dB increase in noise should have no appreciable effect on receptors. Noise level increases from 3 to 6 dB may potentially result in adverse noise impact, but only in the presence of the most sensitive receptors. Sound pressure increases above 6 dB may require closer analysis of impact potential to account for factors including existing sound pressure levels and surrounding land use and receptors.

The NYSDEC program policy defines a typical quiet suburban background sound level at 45 dBA. Therefore, a total cumulative sound level of 51-dBA, or 6-dBA delta above the NYSDEC typical background sound level, would be the threshold for a potential onset of adverse noise impact in quiet suburban settings. The areas with the lowest ambient levels will likely be those located farthest from the nearest major roadways and interstates.

Thresholds would be higher in locations having higher ambient sound levels, such as industrial, commercial, and vacant land areas traversed by the Project. For example, areas near stores may have elevated background sound levels due to operation of building mechanical equipment (e.g., outdoor fans, ventilation systems, etc.).

Estimated sound levels of common noise sources in various outdoor acoustic environments, and comparisons of relative loudness are presented in Table 4-10.

#### **4.10.2      *Permanent Noise Effects***

Permanent noise sources could include the corona effect of the transmission lines under certain atmospheric conditions, such as rain, fog, and high humidity, and minor sources from routine inspection and maintenance of the transmission line. However, audible noise from transmission lines is uncommon when voltages are lower than 300 kV, particularly during dry conditions. Post-construction sound from corona noise, if audible at all, is expected to create minimal noise impacts at only the closest noise-sensitive receptors. As the Project is primarily a rebuild of existing lines, it is expected that the Project will generate noise levels similar to or lower than the existing lines, with only minimal variation related to line geometry and/or conductor-surface conditions. The construction of a new substation that includes transformers will also be a source of permanent noise.

A pre-construction sound study was conducted between March 14-19<sup>th</sup>, 2024 to quantify existing sound levels near the site of the Proposed Jennison Substation. A sound propagation model (noise model) of the proposed transformers was then developed assuming worst-case operation, and the results were compared against the applicable guidance thresholds. The noise modeling indicated that the operation of the substation would result in a 1.2 dBA increase in ambient noise levels at the closest residence, located approximately 0.3 mile from the Proposed Jennison Substation. Table 4-11 summarizes the results of the pre-construction sound survey conducted at the site of the Proposed Jennison Substation in March 2024. The “existing ambient sound level” shown in Table 4-11 was close to the lowest background sound level that was measured during the 4-day sound measurement survey. Furthermore, the measurement survey occurred during late winter, during a time of year when ambient sound levels tend to be lower. The “increases over existing” ambient will be even lower than 1.2 dBA during most other times of the year and/or a 24-hour day.

The NYSDEC noise policy states that an increase of 0 to 3 dBA in noise should have no appreciable effect on receptors, therefore the operation of the Proposed Jennison Substation will have no appreciable noise impact on nearby residences.

Potential tonal sound (hum or buzz) from the transformers was also analyzed. The transformers are not expected to create “tonal” conditions at nearby residences.

As stated above, there is a 0.3-mile distance buffer between the location of the proposed substation transformers and the closest residence, and the surrounding topography will provide a natural sound barrier between the station and residences in many cases. Also, the proposed 56 MVA transformers will be designed to emit no more than 65 dBA at approximately 1 meter. (Similar to a conversation between two people.) When these factors are considered, future substation sound is not expected to be particularly noticeable at nearby residences.

The Jennison Substation Pre-Construction Sound Study report (to be filed separately) presents the results of the study in greater detail.

Post-construction Project inspections and maintenance activities will occur periodically and will generate only minor levels of noise. Traffic noise generated during these activities will be consistent with that already occurring within the Project Area and surrounding areas. These activities will be of short duration; thus, these activities are not expected to result in any significant increased noise impacts.

Routine vegetation maintenance in the Project ROW may require the use of chain saws. The sound level produced by a chain saw depends on the size rating, manufacturer, and equipment condition. Chainsaw activities would be short-term and limited to daytime hours, except in emergency situations.

#### ***4.10.3 Temporary Noise Effects***

Project construction activities will generate temporary noise levels that are periodically audible. These activities will include access road construction, vegetation clearing, grading and excavation, and structure installation along the Project ROW. However, work at each structure location is expected to progress rapidly, thereby significantly reducing the duration of worst-case noise impacts at any one noise-sensitive receptor.

Noise will be generated by construction activities within the Project ROW, off-site access roads, and staging areas. Noise sources may include construction equipment and motor vehicle use by Project workers, and trucks moving material to and from work sites. Various construction activities may occur simultaneously with multiple construction crews potentially operating within the Project Area. The construction equipment is similar to equipment used during typical public works projects and tree service operations. Construction equipment will be properly maintained and will be fitted with mufflers to control noise.

The closest residences are 50 to 75 feet from the closest edge of the Project ROW, but most residences are located between 75 to 100 feet from the closest edge of the Project ROW. Those further residences may experience sound levels 3 to 5 dBA lower than those shown in Table 4-10. Calculated levels at the most conservative scenario for the 50-foot distance exceed the suggested L10 limits by 7 to 16 dBA. For all calculated levels, however, the duration of each specified construction activity is expected to be relatively brief.

#### **4.10.4 Noise Effects and Mitigation**

To minimize noise effects during construction, the Applicant will limit Project construction activities to the hours of 7:00 a.m. to 7:00 p.m. Monday through Saturday. If, due to safety or continuous operation requirements, construction activities are required to occur outside of these hours or on Sundays, the Applicant will notify DPS Staff and the affected municipality at least 24-hours in advance, unless safety considerations prohibit making such advance notice.

Noise levels will also be mitigated by the attenuating effects of distance; the intermittent and short-lived character of the noise; the presence of existing vegetation; the presence of homes and buildings (particularly in the more suburban areas); and the use of functional mufflers on all equipment.

#### **4.11 Electromagnetic Fields**

Opinion No. 78-13 (in Cases 26529 and 26559), effective June 19, 1978, established the Commission's interim standard for an electric field strength of 1.6-kV/m at the edge of the ROW, as calculated at one meter aboveground, with the line at rated voltage. The Commission's Statement of Interim Policy on Magnetic Fields of Major Electric Transmission Facilities (in Cases 26529 and 26559), effective September 11, 1990, set a limit for magnetic fields of 200 mG at the edge of the ROW as measured at one meter aboveground when the circuit phase currents are equal to the Winter Normal conductor rating. Studies of the expected EMF effects using the Winter Normal conductor rating as required by the Commission have been performed for the Project.

The calculated electric field levels at the Project ROW edge do not exceed the NYPSC 60-Hz AC standard of 1.6 kV/m in any modeled cross section along the route of the proposed Project. Similarly, the calculated magnetic-field levels at the Project ROW edges do not exceed the NYPSC 60-Hz AC standard of 200 mG in any modeled cross sections along the proposed route of the Project (see Appendix B - EMF Report).

**Table 4-11: Pre-Construction Sound Study Results Summary**

| <b>Location <sup>1</sup></b> | <b>Existing Sound Level, dBA (L90) <sup>2</sup></b> | <b>Proposed Substation Contribution, dBA</b> | <b>Cumulative: Existing Ambient + Proposed Substation, dBA</b> | <b>Increase Over Existing Sound dBA</b> |
|------------------------------|---|--|--|---|
| R1<br>(closest residence)    | 16  | 11.1   | 17.2   | 1.2                                     |

1. See Figure 1
2. Lowest hourly L90 value measured during March 14-19, 2024 survey (late at night). The measured existing-condition sound level was adjusted using the A-Weighted Noise- Compensated (“ANS”) metric, which effectively removes all high-frequency sound (birds, insects, etc.)
